

with the **Ursina 3D Engine**

What is **python**?

- 1) Who invented it?
- 2) Is it popular?
- 3) Any examples of where it has been used?

What is **python**?

1) Guido van Rossum

2) Yes, very!

3) Google, Instagram, Netflix,
Data Science, Machine Learning...

Python uses modules

```
=====
>>> import random
>>>
>>> print(random.randint(1,10))
2
```

```
from ursina import *

app = Ursina()

app.run()
```

You can import **modules** at the top of your python code.

Different modules allow you to use **different functions**.

The **time** module (time.py) allows you to find the date, time events to the millisecond, and, of course, to get the time of day.

The **random** module (random.py) allows you to get random numbers.

The **ursina** module (ursina.py) allows you to...?

ursina engine

open source game engine

hello world!

Suggested steps:

- 1) Set up a window and get Ursina running
- 2) Create a 3D sphere
- 3) Put a texture on the sphere
- 4) Keep updating the sphere's rotation
- 5) Make a dark background, like space?

Let's make a **3D, rotating world** :)

So, what will we **basically** need to do to make our 3D (hello!) world?

Discuss ideas with a partner, then let's see how well you've **decomposed** the steps in this programming goal.

project setup and assets

1 Create a **new folder** on your H: drive called 'ursina projects'

2 Open **IDLE**

3 Create a new file called **hello.py** and save it in your new folder

4 Find a **planet texture**; also save it into your new ursina folder

Hello World!

```
from ursina import *
```

```
app = Ursina()
```

```
planet = Entity(model='sphere', texture='earth')  
planet.scale = 4
```

```
def update():
```

```
    planet.rotation_y += 0.4
```

```
app.run()
```

Here is our first **python** code. Just 7 lines :)

You must **save your .py file** before you can run it.

Make sure your **planet texture**, in your folder, is named **'earth'**.

Code Challenges!

- 1 Can you **change the rotation speed** of your planet?
- 2 Can you make your planet **change scale** (get bigger or smaller) **as it updates**?
- 3 Can you **add a small moon** -- with its own **texture**?

```
from ursina import *

app = Ursina()

planet = Entity(model='sphere', texture='earth')
planet.scale = 4

def update():
    planet.rotation_y += 0.4

app.run()
```

Changing the window's background colour

`window.color = color.black`

or

`window.color = color.rgb(0,0,0)`

or

`window.color = rgb(255,0,255)`

(shhh because pink)

```
message = Text('<bold>hello world!',background=True)
message.scale=2
message.background.color=color.lime
message.appear(speed=0.1)
```

We can **print text to the screen** :)

First, print '**hello world!**' to the screen.

Next, print whatever message you like.

Can you change the appearance of your text and its background? Can you make a transparent background?
